📘 Without RX (Order Now)

Soma is the brand name for **carisoprodol**, a centrally acting skeletal muscle relaxant. It is used (along with rest and physical therapy) for the short-term relief of discomfort associated with **acute, painful musculoskeletal conditions** such as muscle strains, sprains, or injuries.

It works by affecting nerve activity in the spinal cord and brain, producing muscle relaxation and sedative effects. Its active metabolite (meprobamate) also contributes to its anxiolytic and sedative properties.

Forms and Dosing

- **Tablets**: 250 mg and 350 mg (round, white; often marked "SOMA" with strength).
- **Typical adult dose**: 250–350 mg orally **three times a day and at bedtime** (max 4 doses/day).
- **Duration**: Limited to **2–3 weeks** maximum, as evidence for longer use is lacking and acute conditions are usually short-term.

Not recommended for children under 16. Lower doses or caution in elderly patients, those with liver/kidney impairment, or reduced CYP2C19 activity (poor metabolizers). It is a **Schedule IV controlled substance** in the US due to abuse and dependence potential.

Common Side Effects

- Drowsiness or sedation (most common).
- Dizziness.
- Headache.
- Increased clumsiness or ataxia.

Serious Risks and Warnings

- **CNS depression**: Can impair driving/operating machinery. Additive effects (potentially fatal respiratory depression, sedation, coma) when combined with alcohol, opioids (e.g., oxycodone, Percocet), benzodiazepines (e.g., Xanax, clonazepam), Ambien, or other sedatives.
- **Dependence, tolerance, and withdrawal**: Habit-forming. Abrupt stopping after prolonged use can cause anxiety, insomnia, tremors, muscle twitching, or seizures.
- **Overdose**: Severe drowsiness, respiratory depression, hypotension, seizures, coma, or death.
- **Other**: Allergic reactions, seizures (rare), abuse potential (often sought for its euphoric/sedative "high").

Contraindications: Acute intermittent porphyria, hypersensitivity to carisoprodol or meprobamate.

Major Safety Warning: Counterfeits and Misuse

Soma/carisoprodol tablets are sold illicitly (sometimes called "somas") and appear in counterfeit combinations (e.g., with tapentadol as "red apples"). Fake pills may contain **fentanyl**, other opioids, or unknown substances, leading to overdose or death. Street or online purchases are highly risky — counterfeits can look identical to legitimate ones.

This is **general information only and not medical advice**. Soma is intended for very short-term use only. Non-drug approaches (physical therapy, NSAIDs, etc.) or other muscle relaxants are often preferred for ongoing issues. Consult

a healthcare provider for personalized guidance, prescriptions, interactions, or tapering. If you suspect overdose, counterfeit ingestion, or severe effects, seek emergency medical help immediately (naloxone may reverse opioid components if present).
